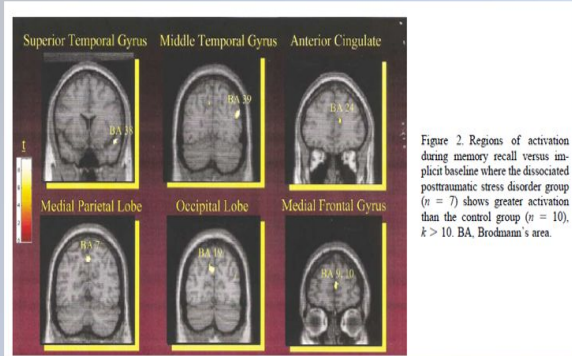

Figure 2. Regions of activation during memory recall versus implicit baseline where the dissociated posttraumatic stress disorder group ( $n = 7$ ) shows greater activation than the control group ( $n = 10$ ),  $k > 10$ . BA, Brodmann's area.

Prefrontal and limbic structures underlie dissociative responses in PTSD.

Differences observed clinically, psychophysically, and neurobiologically between patients with dissociative versus non-dissociative responses may suggest different neuronal mechanisms underlying these two distinct reactions.
